

RETENTION BASINS & TALL GRASS

Lush perennials provide shade and hiding places for frogs & grass snakes

Around the retention basin, which is occasionally filled with rainwater from the roof, moisture-friendly plants that need lots of nutrients thrive. Large and small animals often hide in the thicket – its particularly practical for amphibians and grass snakes, which live both in water and on land. Dragonflies spend their childhood in the water and emerge from there when they develop into adults. Our retention basins provide an ideal home for both the larvae and the adults.

Beautiful flowers even late in the year.

Many perennial plants bloom late in the year. It's just when the main flowering period of many meadows is over that the tall herbaceous meadows become really colorful, which allows butterflies and other nectar-sucking insects to feed well into the fall.

Butterflies visit from the forest

Butterflies like to stay at the edges of forests and in sparse woodlands with tall herbaceous plants. Who knows, maybe our tall shrubland is so attractive that it will take the adventure from the Aegert forest to us here at LUZI.
